ABOUT ME

I am a 4th-semester student at Batam State Polytechnic majoring in Informatics Engineering (D3). I am currently studying while working by taking evening classes, which has shaped me into a disciplined and highly motivated learner. I have a strong interest in pursuing a career in the manufacturing industry as a programmer. I have experience developing website, IoT, and AI projects, and I am familiar with several programming languages such as HTML, CSS, JavaScript, Python, C++, PHP, and MySQL. I have also worked with various frameworks and tools including Tailwind CSS, Laravel, Bootstrap, Three.js, and Grafana.

EDUCATION

2024 - 2027

D3 - Teknik Informatika

Batam State Polytechnic

With an average grade: 3.71 / 4.00 (Semester 1-3)

WORK EXPERIENCE / PROJECT

PT Ciba Vision Batam – Production Technical Operations

11 Jan 2023 - 10 Jul 2025

My Responsibilities:

- Operated injection molding machines, including machine setup and parameter preparation.
- Performed microscope-based visual inspections to ensure products were free from defects, flash, or dimensional inconsistencies.
- Supported assembly processes, providing manpower for production operations.
- Handled chemical technical operations and worked with micron-sized components, ensuring precision and compliance with safety standards.

Academic Project - Content Management System For Clothing Shop UMKM

08/2024 - 01/2025

Client: SME Traders

Role: Frontend Developer

- Developed consistent and user-friendly UI for the Home, Products, About, and Profile pages.
- Developed responsive mobile navbars and menus using Tailwind CSS.
- Designed informative and easy-to-understand product detail pages.
- Implemented transitions and interactions to improve UX.
- Performed responsiveness testing on various devices (mobile, tablet, desktop).

Academic Project - Monitoring PLTS Based on IOT For Electric Vehicle

05/2025 - 01/2026

Client: Student S2 in batam state polytechnic

Role: IoT Developer

Technology: ESP32, transmitter, receiver, thermocouple, battery, and solar panel

This project aims to build a monitoring system for a solar power plant (PLTS) used as a charging source for electric vehicles. The system is designed to monitor critical parameters such as voltage, current, power, and battery status in real time using the Internet of Things (IoT) concept.

My Responsibilities:

- Designed and developed the electronic circuit using Fritzing to visualize component layout and ensure proper hardware configuration.
- Programmed the ESP32 in C++ to accurately read voltage, temperature, and current using integrated sensors.
- Conducted device testing and calibration to verify measurement accuracy and system reliability.
- Implemented Python-based data transmission to send sensor readings to the server, enabling real-time visualization on the dashboard monitoring page.

Academic Project - Development of an Integrated Monitoring System in the Testing Bay

02/2026 - Now

Client: Pt. Spm Oil and Gas

Role: Computer Vision Engineer

Technologies: Python, Computer Vision, MediaPipe, IoT, Database, Dashboard Monitoring

This project aims to develop an integrated monitoring system for a testing bay in a manufacturing environment. This system is designed to improve safety and efficiency by combining computer vision, IoT sensors, and dashboard monitoring in a single, unified platform.

My Responsibilities:

- Develop a computer vision module to detect operator presence or gestures in the testing bay.
- Integrate data from IoT sensors and cameras into a single monitoring system.
- Collaborate within a team to integrate hardware, software, and data visualization.

TECHNICAL SKILLS

- Languages: C++, Python, PHP, JavaScript
- Web & Frameworks: Laravel (MVC), HTML5, CSS3, Tailwind CSS
- IoT & Tools: ESP32, Arduino IDE
- Database & Visualization: MySQL, Grafana
- Dev Tools: Git, GitHub, Docker

HOBBY

Listening to music, Playing guitar, Playing games, Learning new things
